

Putty naudojimas

### ?vadas

Yra keletas program?, skirt? darbui su SSH i? Windows sistem?. Populiariausia ir lengviausia naudoti yra ?Putty?.

Parsisi?sti galite i? ?ia:

<http://www.chiark.greenend.org.uk/~sgtatham/putty/download.html>

### Naudojimas

1 – Paleiskite Putty

2 – **Host Name (or IP address)** laukelyje ?veskite serverio IP adres? arba domen? (jeigu naudojate ?Pro? ar didesn? prieglobos plan?, galite ?vesti plano\_pavadinimas.ovh.net, pvz., **pro.ovh.net**).

3 – Spragtel?kite (pa?ym?kite) SSH.

4 – Spragtel?kite mygtuk? **Open**.

5 – ?veskite prisijungimo vard?: vartotoj?, jeigu serveris ar domen?, jeigu priegloba.

6 – Spauskite klaviat?ros mygtuk? **Enter**.

7 – ?veskite vartotojo (jeigu jungiat?s prie serverio) arba FTP (jeigu jungiat?s prie prieglobos) slapta?od?.

8 – Spauskite klaviat?ros mygtuk? **Enter**.

9 – Prisijung? prie prieglobos matysite prane?im? (jungiantis prie serverio pradinis prane?imas priklauso nuo jame ?diegtos sistemos):

Hello,

Starting programs on the background is **PROHIBITED !**

All activities linked with IRC (bounce, irc, etc) are **PROHIBITED!**

You must stay in your directory. Do not read/open the system files.

Your account is under surveillance and in any case where you break any of these rules, your account will be immediately suspended !

If you launch a dump in the sql database and if you exceed the usage limits of the server, you will receive an alert to your webmaster@ postmaster@.

If you are developping programs with C: you must work on a server that runs redhat 6.2 with glibc 2.1.3. version GCC of egcs-2.91.66
